1947 PULPWOOD PRODUCTION BY COUNTY IN THE SOUTHEAST

by

James F. McCormack, Forester
Division of Forest Economics

SOUTHEASTERN FOREST EXPERIMENT STATION
ASHEVILLE, NORTH CAROLINA

I.T. HAIG, Director

PREFACE

Through the McSweeney-McNary Act of 1928, Congress authorized the Secretary of Agriculture to conduct a comprehensive survey of the forest resources of the United States. The Forest Survey was organized by the Forest Service to carry out the provisions of the Act, and each of the 11 Regional Forest Experiment Stations is responsible for the work in its territory. In the Southeastern States the Forest Survey is an activity in the Division of Forest Economics of the Southeastern Forest Experiment Station, Asheville, North Carolina.

The work of the Survey is divided into five major phases:

1. Inventory. Determination of the extent, location, and condition of forest lands, and the quantity, species, and quality of timber on these lands.
2. Growth. Determination of the current rate of timber growth.
3. Drain. Determination of the amount of industrial and domestic wood used, and the total loss resulting from fire, insects, disease, suppression, and other causes.
4. Requirements. Determination of the current and probably future requirements for forest products by all classes of consumers.
5. Policies and plans. Analysis of the relation of these findings to one another and to other economic factors as a basis for public and private policies and plans of forest land use and management.

This progress report summarizes information on the 1947 production of pulpwood obtained in the course of compiling annual forest drain statistics by states and survey units.

Acknowledgments

The production statistics contained in this release could not have been published without help from many sources. The author gratefully acknowledges the cooperation and assistance provided in the collection of the basic field information by the management of all reporting pulpmills, and by James W. Cruikshank and John J. Zirkle, staff members of the Southeastern Station. Acknowledgment is also due to Mrs. Christine Johnston, Miss Camilla Young, and other members of the Southeastern Station for assistance in compiling the statistics.

1947 PULPWOOD PRODUCTION BY COUNTY IN THE SOUTHEAST

This statistical release presents data by county on volume and kind of pulpwood produced during 1947 in Virginia, North Carolina, South Carolina, Georgia, and Florida. It is third in a series of annual reports on pulpwood production published by the Southeastern Forest Experiment Station. The first report covered 1945 production in the Carolinas and Virginia, and the 1946 report covered all five states.

These data were compiled from information furnished by all the pulp companies located in, or drawing wood from, the five-state Station territory. Each company reported its total production by county, or by shipping points which were used to assign production to counties. Therefore, these data show the approximate production for some counties and should not be accepted as free of error. However, errors in assigning production to counties tend to be compensating, and production summaries for groups of counties, survey units, or states will be sufficiently accurate for general use. The maps showing production by counties are believed to be accurate since the class intervals are broad enough to compensate for errors in the individual county data.

A total of 11,041 cords of sawmill slabs and 20,462 cords of veneer cores used as pulpwood were listed in the company reports. During compilation of the data, these volumes were removed so that the tables would show, for softwood and hardwood species groups, only the production from sound live timber. The chestnut wood production is, of course, entirely from dead timber.

All volumes are reported in terms of the 128 cubic-foot standard cord. The softwood volume includes all of the southern yellow pines and also a small amount of hemlock in North Carolina Survey Unit 4. About ninety percent of the hardwood production is made up of blackgum and sweetgum with the blackgums predominating. The remainder is principally soft maple, yellow-poplar, and species of oak. The four survey units in South Carolina for which 1946 production data were published have been changed back to the three original units, since users of these data found difficulty in making comparisons with previously published information.

A new map (fig. 1) showing the intensity of pine pulpwood production by county in relation to pine growing stock is included in this release. Its purpose is to show areas of heavy drain on growing stock which may or may not be correlated with areas of heavy production. This map is based on pine pulpwood production only and does not include drain created by lumber, fuelwood, or other products.

Total pulpwood production in the five states for 1947 was 4.8 million cords, an increase of 2.6 percent over 1946 and 11.5 percent over 1945. The state of South Carolina shows a decrease of 7 percent in total production, but production in all other states increased. The use of hardwoods decreased slightly in 1947, but the reported use is still well above the 1945 level.

	2	246,323	632	-	246,955
	3	111,879	-	-	111,879
	4	295	-	-	295
	All units	880,469	1,242	-	881,711
All states	Total	4,171,261	406,711	257,928	4,835,900

^{1/} Includes only chestnut used for pulp; an additional volume was used by plants making only tanning extract.

^{2/} For location of survey units, see Figure 1.

^{3/} For comparison, the 1946 production in South Carolina by original survey units was as follows: Unit 1 - Softwoods 287,942 cords, hardwoods 36,957 cords; Unit 2 - Softwoods 323,188 cords, hardwoods 50,989 cords; Unit 3 - Softwoods 298,109 cords, hardwoods 24,606 cords.
